

# Plain-Language Rewrite

The page never says what Wozku is in a sentence a stranger could repeat. It describes the problem for three sections first. Here's the comprehension test, and the copy to fix it.

## 01 / THE TEST

### Would a brand-new founder understand this?

#### ANSWER

**No.**

But before you act on that — the very first line of copy on the page is **"For B2B field marketers & event managers."** A brand-new founder reads that and correctly concludes it isn't for them. That's targeting working, not content failing.

#### WHICH MEANS THE TEST NEEDS ONE ADJUSTMENT

You can't serve a founder with zero marketing knowledge *and* a field marketer with a \$25K booth budget on one page. The copy that makes a field marketer think "this is exactly my problem" — booths, badge scans, speaker kits — is the same copy that loses the founder. Chasing both produces a page that converts neither.

So the question worth optimising against is: **would a busy field marketer, three seconds after tapping an ad on their phone, understand what Wozku actually does?**

#### ANSWER TO THAT ONE

**Maybe.**

Which is your improvable case — and the fix is smaller than a rewrite of everything.

If the founder genuinely is a target buyer, that's a positioning decision, not a copy one — and it needs a separate page with its own ad. Don't try to solve it by softening this one.

## 02 / DIAGNOSIS

### Two problems, and only one of them is length

#### ROOT CAUSE

#### No sentence says what Wozku is

Read the whole page and you'll never find a plain sentence a visitor could repeat to a colleague. The closest is the footer — "The Advocacy-Led Growth platform for B2B field marketers and event managers" — which is a category label, not an explanation. The hero says Wozku "uses 1-click sharing and gamification to turn your captive audience into a massive digital growth engine." Three abstractions, no picture.

#### ROOT CAUSE

#### The explanation is 800 words in

The clearest thing on the page is **auHow**: attendees scan a QR code at your booth, tap once, a pre-written post goes to their LinkedIn, they earn points and win swag. Anyone understands that instantly. It's section 6 of 9. A cold visitor should never travel 800 words to find out what the product is.

The page opens with three sections of problem — 447 words on ignored promo kits, ghost-town booths and dead hashtags — before it explains the mechanism. Problem-first is a real structure, but it only works when the reader already knows the category. From a cold ad click, "what is this" has to land on the first screen.

1,137 words before the thank-you screen — roughly 5.7 minutes. Gated-asset pages for cold paid traffic typically run 300–600.

### 03 / VOCABULARY

## Words the page assumes you already know

Some of these are fine for the ICP and should stay. Others are doing damage — flagged.

| TERM                                 | VERDICT | NOTE                                                                                                                                                                     |
|--------------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| advocacy / advocates                 | DEFINE  | The entire product rests on this word and it's never explained. Plain version: <b>the people already in the room</b> — your attendees, speakers, sponsors and reps.      |
| \$140+ CPC                           | DROP    | CPC is never expanded, and \$140 is far above typical B2B benchmarks. A marketer who knows the number will distrust everything else on the page. Source it or remove it. |
| 94% of promo assets never get shared | SOURCE  | Unattributed. A hard statistic with no citation reads as invented — and it's sitting in your first problem panel.                                                        |
| gamification                         | REPLACE | Say what it does: <b>they earn points and win swag</b> . Concrete beats the category word.                                                                               |
| captive audience                     | REPLACE | Unintentionally negative. "The people already at your event."                                                                                                            |
| digital growth engine                | REPLACE | Means nothing specific. Cut it.                                                                                                                                          |
| the viral calculus                   | REPLACE | Just call it "The math" — which the sub-headline already does.                                                                                                           |
| 10x10 booth                          | REPLACE | Trade-show units. "A typical booth" costs nothing and loses no one.                                                                                                      |
| activate (verb)                      | REPLACE | "What could you activate?" → "What could your next event bring in?"                                                                                                      |
| organic pipeline                     | KEEP    | Fine for the ICP.                                                                                                                                                        |
| badge scan                           | KEEP    | Fine — and it's the vocabulary that signals you know their world.                                                                                                        |
| promo kits                           | KEEP    | Every field marketer has built one.                                                                                                                                      |

## Section by section, ready to paste

### Hero

#### NOW

FOR B2B FIELD MARKETERS & EVENT MANAGERS

### **Stop *begging* your sales reps and speakers to promote your events.**

You spend months planning B2B events, but your attendees, speakers, and sponsors aren't sharing them. Wozku uses 1-click sharing and gamification to turn your captive audience into a massive digital growth engine.

Get the free playbook: the exact 1-click system top B2B teams use so speakers and reps actually share your events.

84 words

#### PROPOSED

FOR B2B EVENT & FIELD MARKETING TEAMS

### **Get more leads from the events you're already paying for.**

At your booth, attendees scan a QR code and tap once — a ready-made post goes out to their LinkedIn, and they earn points toward swag. You get the reach you were paying LinkedIn for.

Free playbook · 4 chapters · no sales call

48 words · explains the product in one sentence

**This is the single most important change on the page.** That subhead is the sentence that currently doesn't exist anywhere — it names who acts (attendees), what they do (scan, tap), what happens (a post goes out), what they get (points, swag) and what you get (reach). A stranger can repeat it. Keep "Stop begging..." as your A/B challenger; it's a strong line, it just doesn't explain anything.

## Then: how it works, moved to position 2

### KEEP, RELABEL

#### Three steps, plainer headings

"Scan & activate" → **They scan**

"Preview & share" → **They tap once**

"Earn rewards & climb" → **They win something**

The illustrated panels underneath are the best work on the page — the phone mock, the pre-written LinkedIn post, the leaderboard. Leave them exactly as they are. Only the labels change.

### COMPRESS

#### Problem section drops to one line

All three bottlenecks — promo kits, ghost-town booth, dead hashtag — compress into a single line above the three steps:

**"You paid for the room. Right now the reach stops when everyone flies home."**

179 words → 14. The visitor already agreed with the premise; they clicked the ad.

## Then: the math, merged with the calculator

### MERGE

**auMath** already ends with "Run your own numbers" and **auROI** is a full calculator.

They're one section. Show the default comparison — **50 badge scans is your ceiling → 125 leads, same booth, same spend** — and let "run your own numbers" expand into the sliders beneath it. One section instead of two, and the calculator still collects everything you want from a lead.

Rename the eyebrow from "The viral calculus" to **"The math"**, and "The 10x10 booth • the old way" to **"A typical booth, today."**

## Then: proof, in one band

### CUT & COMPRESS

Cut **auSpotlight** entirely — 184 words of flip-card testimonials that require a drag to read. Keep the Red Hat banner as the one narrated proof point (987 net-new registrations, \$0 paid media — it names a number and a mechanism in one breath). Reduce **auProof** to a single row: four logos, one number each, no summaries.

329 words of proof become about 60, and you lose no logos.

## Then: the playbook

### KEEP AS BUILT

**auCta** is the best-constructed section you have — the cover, the four named chapters with page numbers, the second email field, and "Takes under 15 minutes to launch • Zero coding required" as risk reversal. Change nothing except adding one line of consent microcopy under the field: **"We'll email the playbook. No spam, unsubscribe anytime."**

### 05 / RESULT

## Nine sections become five

| # | SECTION          | JOB                                                               | WORDS |
|---|------------------|-------------------------------------------------------------------|-------|
| 1 | Hero             | What it is, what you get, email field                             | ~48   |
| 2 | How it works     | Three steps. The clarity engine — moved up from position 6.       | ~110  |
| 3 | The math         | 50 → 125, with the calculator folded in as "run your own numbers" | ~130  |
| 4 | Proof            | Logos, Red Hat, four numbers. One band.                           | ~60   |
| 5 | Get the playbook | Cover, chapters, form, consent line                               | ~75   |

Roughly 425 words and about two minutes. Nothing of substance is gone — the case studies keep every logo, the calculator keeps every input, the illustrated how-it-works panels are untouched. What's gone is the third restatement of the problem and the fourth serving of proof.

**One test to run before you ship it:** show the new hero to someone in your company who has never seen the product — sales ops, an engineer, anyone. Give them five seconds, take it away, and ask them to describe what Wozku does. If they can say "people at your event scan a code and it posts to their LinkedIn," the copy works. If they say "it's a marketing platform," it doesn't.

---

Word counts measured from the live `index.html` build. Companion to the ad-to-playbook audit — the structural and message-match findings there still stand.
