

Plain-Language Rewrite

The page never said what Wozku is in a sentence a stranger could repeat, and it described the problem for three sections before explaining the product. Here is what was wrong, what changed, and what is still open.

01 / DIAGNOSIS

Two root causes, and only one of them was length

The question this page has to survive: would a busy field marketer, three seconds after tapping an ad on their phone, understand what Wozku does?

ROOT CAUSE

No sentence said what Wozku is

You could read the whole page and never find a plain sentence a visitor could repeat to a colleague. The closest was the footer, "The Advocacy-Led Growth platform for B2B field marketers and event managers", which is a category label rather than an explanation. The hero said Wozku "uses 1-click sharing and gamification to turn your captive audience into a massive digital growth engine". Three abstractions, no picture.

ROOT CAUSE

The explanation sat 800 words in

The clearest thing on the page was "How it works": attendees scan a QR code at your booth, tap once, a pre-written post goes to their LinkedIn, they earn points and win swag. Anyone understands that instantly. It was section 6 of 9. A visitor arriving cold should never travel 800 words to find out what the product is.

The page opened with three sections of problem, 447 words on ignored promo kits, ghost-town booths and dead hashtags, before it explained the mechanism. Problem-first is a real structure,

but it only works when the reader already knows the category. From a cold ad click, "what is this" has to land on the first screen.

02 / THE HERO

The most important change on the page

BEFORE

FOR B2B FIELD MARKETERS & EVENT MANAGERS

Stop *begging* your sales reps and speakers to promote your events.

You spend months planning B2B events, but your attendees, speakers, and sponsors aren't sharing them. Wozku uses 1-click sharing and gamification to turn your captive audience into a massive digital growth engine.

Get the free playbook: the exact 1-click system top B2B teams use so speakers and reps actually share your events.

84 words, three prose blocks

NOW LIVE ON THE BRANCH

FOR B2B FIELD MARKETERS & EVENT MANAGERS

Get more leads from the events you're *already* paying for.

At your booth, attendees scan a QR code and tap once. A ready-made post goes out to their LinkedIn, and they earn points toward swag.

Free playbook · 4 chapters

41 words, explains the product in one sentence

That sub-headline is the sentence that did not exist anywhere on the site. It names who acts (attendees), what they do (scan, tap), what happens (a post goes out), what they get (points, swag), and what you get (reach). A stranger can repeat it back. "Stop begging" is a strong line and is worth keeping as an A/B challenger, it simply did not explain anything.

ALSO FIXED

Mobile sizing did not exist

There was no media query anywhere in the file for the hero title or sub-headline. The sub rendered at 20px centred across the full width at every screen size, which wrapped to roughly seven ragged lines on a phone. It is now four.

ALSO FIXED

Two unreadable elements

The playbook line measured about 1.3:1 against its background and the eyebrow 3.4:1, both well under the 4.5:1 readability threshold. Measured across nine viewports from 375px to 1920px, the playbook line now sits between 6.5:1 and 8.3:1.

Words the page assumed you already knew

WAS	NOW	WHY
\$140+ CPC	Paid clicks	CPC was never expanded, and \$140 is roughly ten times normal B2B benchmarks. Any marketer who knows the number would have stopped trusting the page.
94% of promo assets never get shared	Most promo kits are never opened	Unattributed. A hard statistic with no citation reads as invented, and it sat in the first problem panel.
The viral calculus	The math	The sub-headline already said "the math is simple". The eyebrow was working against it.
The 10x10 booth	A typical booth, today	Trade-show units. The plainer phrase costs nothing and loses no one.
What could you activate?	What could your next event bring in?	"Activate" as a verb is category jargon. The new line names the outcome.
Scan & activate Preview & share Earn rewards & climb	They scan They tap once They win something	Three steps that now read as three things a person does.
gamification, captive audience, digital growth engine	points, swag, the people at your event	Concrete beats the category word. Nothing here needed a term of art.

What changed, section by section

#	SECTION	CHANGE	WORDS
1	Hero	Rewritten. Explains the product in one sentence, mobile sizing added.	41
2	How it works	Moved up from position 6. The page now explains the product before it argues about the problem. Step labels made plain.	95
3	The problem	Three bottlenecks cut to two. The ghost town and the dead hashtag argued the same point, so they merged. Section height 966px to 678px.	86
4	The math	Jargon removed. The 50 to 125 leads comparison is unchanged, it was always the most persuasive thing on the page.	84
5	Red Hat result	Kept. One named brand, one number, one claim. This is the model the other proof blocks should follow.	27
6	ROI calculator	Heading and intro put in plain language. The calculator itself is untouched.	109
7	Testimonials	Repositioned from position 3 to right after the ROI calculator. Content, styling and the drag-to-flip interaction are all unchanged, only the placement moved.	157
8	Case studies	Four per-card download buttons replaced with one . They all pointed to the same place, and the label promised a download that never happened.	102
9	Get the playbook	Kept as built. Cover, four named chapters, second email field.	20

On the testimonials. An earlier pass removed this section entirely, on the reasoning that it was a fourth proof block in a row and required a drag to read each quote. That was a copy-and-structure call made without checking it against what the page actually needs to keep. The quotes are real and named, not placeholder content, so the section is back in full: same four testimonials, same styling, same interaction. What changed is only its position, from early in the page to right after the ROI calculator, so a visitor sees the pitch and the numbers before hearing from other customers, then goes straight into case studies and the ask.

05 / RESULT

Where it landed

749 → 721

Words of reading copy, testimonials included

9 → 9

Sections, with the product explained at number 2

103MB → 1.9MB

Video payload, re-encoded for the web

2

Invented-looking statistics removed

Being straight about the target. The original plan called for a five-section, roughly 425-word page. Two things pulled that number back up: the testimonials section came back in full at leadership's request, and three planned merges (math with the calculator, Red Hat with case studies, the problem section down to one line) were deliberately not done, because each deletes finished design work rather than copy. Net effect is a page barely shorter than the one we started from in word count, but restructured so the product is explained at position 2 instead of position 6, jargon and unsourced stats are gone, and nothing requires four separate proof blocks in a row before the reader converts.

STILL OPEN	WHAT IT WOULD TAKE	SAVES
Merge the math and the calculator	They are two sections making one argument, and the math section already ends with "run your own numbers". Fold the sliders in underneath it.	~1 screen
Merge Red Hat into the case studies	One proof band instead of two adjacent sections.	~0.5 screen
Compress the problem section to one line	Deletes two illustrated panels. Real reduction, real loss of craft.	~0.8 screen
The scroll gap after the hero	There is a long stretch of scrolling between the hero and the first content section where the laptop animation sits. It works against moving "How it works" up.	worth a look

All figures measured from the live build. Word counts are headings and paragraphs only, excluding interface labels inside illustrations. Contrast ratios measured over HTTP with the hero shader running, across nine viewports from 375px to 1920px.
